

The new Capital Inventions website goes live!

After months of work behind the scenes we are proud to present to you the new online home of Capital Inventions.

The 19th January, 2012 was a landmark date for Capital Inventions with the launch of the new website, bringing a brand new fresh design and functionality to the Capital Inventions group.

The website though is more than just a pretty face, with cutting edge functionality, inventors can now use the site to showcase their own innovations and inventions.

How? I hear you ask, well its quite simple!

Step 1 - Sign up & Log in

Simply register an inventor account in our Inventions Directory (directory.capital-inventions.com/portal-inventor). Once reviewed and approved by an administrator, you can log in and start using all the facilities of the system.

Step 2 - Choose a subscription

There are multiple ways to advertise your creations - from short term plans like a one-time listing in our monthly newsletter, to a full yearly subscription allowing you to show complete details about your inventions on our Directory.

Visit the new Capital Inventions website today and create yourself an inventors account. Just click here!

Portable electronic device to reduce blood clots

Geko is a wristwatch-sized, self-adhesive band that stimulates blood flow....

UK-based Geko believe current devices designed to address the problem of Deep vein thrombosis are cumbersome and ineffective, and have therefore launched a wristwatch-sized, self-adhesive band which reduces the risk of clotting by stimulating blood flow.

The disposable device weighs 16 grams and attaches to the back of the patient's knee. Powered by a wristwatch-sized battery, two electrodes stimulate the peroneal nerve which causes micro-contraction of the calf muscle

and increased local blood circulation. The action simulates the process normally achieved by walking. The software is controlled by a single button, with seven levels of stimulation indicated by a flashing green LED. The one-size-fits-all device can be applied in 60 seconds and is designed to allow for full freedom of movement. The battery lasts for 24 hours, after which the device can be disposed of safely as clinical waste.
